

● Critical Issue #1 — Admin middleware is vulnerable

This is the biggest issue I've found so far.

Your middleware only checks whether the `session` cookie exists:

🔗 1. Homepage fetches everything before rendering (Highest impact)

Your homepage waits for all product sections, categories, and reviews before sending the page. This means one slow Firebase query delays the entire page.

🔗 2. Firebase is queried many times on every homepage request

3. Check for unnecessary client components

🔗 1. Multiple Firestore queries for the homepage

2. Sorting is happening in Node.js instead of Firestore

Roles & Permission not aligned. After assign role to person sign in , there is no admin panel visible.

Sign in page not working properly . Once someone sign in, page stays there but it has to be gone automatically and provided signed in with avtar. Here manual refresh needed for same.
